Subject: Data Review

Mike,

Fred informed me that you are reviewing the Cabot and PADEP data for Dimock. Here are some questions we have raised and I just haven't had time to go through the data. If while you are reviewing the data you see the answers to these question would you let me know?

- Glycols - method 8015 and 8015M are referenced. Is there any explanation in the report from TestAmerica on what the modifications were for these methods? Any presence of the glycols in blanks? I have a request into TestAmerica for a copy of their 8015M method since we are very much interested in the settings for GC/FID on ethylene glycol analysis. Any QC for the ethylene glycol?

- Bis (2-ethylhexyl) phthalate (DEHP) was present at low levels 2.5ug/L - was this compound found in any of the blanks? Do those values look good?

- Did TestAmerica document any interferences with the metals?

Cindy
